

Universal Unified Theory, Life Conduction System and Intelligent Medical Treatment

A Unified Scientific System from Cosmic Physics to Medical Application

Abstract

This paper constructs a comprehensive, bottom-up, logically self-consistent unified scientific system that covers the entire universe and can be observed, verified, and falsified. It integrates three core components: cosmic universal unified theory, life conduction system theory, and intelligent medical treatment, forming a complete theoretical closed loop from microscopic particles to celestial bodies, from physical laws to life mechanisms, and from the essence of disease to intelligent health management.

Based on the minimum material units and four core evolutionary conditions (time, temperature, velocity, and spatial compression), this paper establishes a unified energy field formula that achieves a unified description of physical quantities across all scales. On this basis, the life conduction system theory is derived, revealing that health, disease, and cancer essentially originate from the patency or disorder of the nerve-blood circulation unified regulatory system. The paper further reflects on the directional bias of modern medicine in the fields of chronic diseases and tumors, and proposes a new medical direction centered on repairing conduction, restoring homeostasis, and activating self-healing. Finally, a non-invasive, inclusive, and compliant multi-modal AI intelligent health assessment system is constructed.

The entire system is rigorous, coherent, and based on real observations. It provides original and systematic theoretical support and application paths for basic science, geodynamics, earthquake early warning, life science, and national intelligent medical treatment.

Keywords: universal unified theory; minimum material unit; unified energy field formula; life conduction system; nerve-blood circulation regulation; essence of disease; cancer mechanism; reflection on modern medicine; intelligent medical treatment; AI health assessment

1 Introduction

Modern science has developed along a path of highly fragmented disciplines, leading to disconnections between physics, geoscience, life science, and medicine. There is a lack of unified ontological basis and logical framework. Basic physics struggles to explain life phenomena, and medicine finds it difficult to trace the systematic roots of diseases. As a result, major diseases such as chronic diseases and tumors remain at the level of symptomatic treatment without radical cures.

To break through disciplinary barriers, this paper adopts a unified scientific perspective. Starting from the most fundamental material existence in the universe, it gradually deduces material structure, celestial motion, geodynamics, life operation laws, and disease mechanisms, and finally implements an intelligent medical system, forming an original theoretical system that connects the cosmos, life, and medicine.

2 Core Framework of Cosmic Unified Theory

2.1 Minimum Material Units

The underlying existence of the universe consists of indivisible, immutable, and constant minimum material units with inherent type differences. They are the common carriers of all particles, fields, matter, celestial bodies, and living organisms. The diversity of material forms is not caused by essential changes in the units themselves, but jointly determined by the number of units, arrangement structure, condensation degree, and external evolutionary conditions.

2.2 Four Core Conditions of Material Evolution

All material structure, motion, and energy change are governed by four measurable conditions:

1. Time: the sequential carrier of material change;
2. Temperature: the core variable of microscopic motion intensity and structural stability;
3. Velocity: macroscopic motion state and energy coupling term;
4. Spatial compression: the ratio of internal to external spatial pressure, determining material compactness, deformation tendency, and energy constraint state.

2.3 Unified Energy Field Formula

The universal unified energy effect is expressed as:

$$\Phi = (\epsilon_x \cdot v^2 \cdot t \cdot T) / \epsilon$$

Where:

- Φ : universal unified energy effect
- ε_x : intrinsic energy term based on hydrogen ground state
- v : macroscopic velocity
- t : cumulative action time
- T : thermodynamic temperature
- ε : spatial compression coefficient

This formula uniformly describes the energy states of microscopic particles, fields, celestial bodies, geological movements, and biological systems, enabling unified comparison and calculation across all scales.

2.4 Unified Interpretation of Earth and Celestial Systems

Within the unified theoretical framework, the Earth and the Moon formed simultaneously from the same nebula in a stable accretion process. The mainstream giant impact hypothesis is not supported by dynamic stability, orbital order, or observational evidence. Driven by rotational inertia drag and equatorial thermal pressure, global plates move generally northeastward. The intensity and risk of earthquakes and tsunamis are determined by the dynamic coupling between plate motion and Earth's rotation. Near-Earth object impacts are not completely random but guided by an axial force field capture mechanism and thus predictable.

3 Life Conduction System Theory: From Cosmic Laws to Life Essence

3.1 Unified Physical Essence of Life

Life is a dynamic energy homeostasis system formed by minimum material units at the biological scale, whose operation strictly follows the cosmic unified energy field mechanism.

3.2 Composition of the Life Conduction System

The human body possesses a unified life regulation system centered on nerve conduction and blood circulation conduction:

- Nerve conduction: rapid electrical signal and neurotransmitter regulation for global command;
- Blood circulation: material transport, metabolic exchange, and chemical signal transmission for global supply.

Together they form the life conduction system, which exerts full-time and all-round control over all cells in the body and constitutes the fundamental basis for sustaining life activities.

3.3 Unified Interpretation of Health, Disease, and Cancer

- Health: the conduction system is unobstructed and ordered, and energy homeostasis is within the normal range;
- Disease: conduction block, signal disorder, or interruption, leading to the destruction of the cellular microenvironment;
- Cancer: deep and long-term disorder of the local conduction system, causing cells to lose normal regulation and proliferate uncontrollably. It is a systemic disease rather than a simple local cellular mutation.

The core reason why cancer is difficult to cure is that modern treatments mostly target tumor lesions without repairing the nerve-blood circulation conduction system at the root.

4 Systematic Reflection on the Direction of Modern Medicine

Modern medicine is based on reductionism and excessively focuses on local results such as cells, genes, and molecules, attributing diseases to microscopic abnormalities while ignoring the overall conduction system as the root cause. The consequences are:

- Chronic diseases such as hypertension and diabetes rely on long-term medication without radical cure;
- Tumors are treated mainly by resection and killing, making it difficult to prevent recurrence;
- Treatments are confrontational and destructive, lacking systematic repair mechanisms.

If the unified theory holds, modern medicine has an obvious directional bias in the fields of chronic diseases and tumors. The core direction of future medicine should shift to:

- Unblocking conduction obstruction
- Repairing nerve and circulation signal regulation
- Reconstructing systemic energy homeostasis
- Activating the body's self-healing ability

5 Intelligent Medical System Based on Unified Theory

5.1 System Positioning

A non-invasive, low-cost, compliant, safe, and universally accessible multi-modal AI intelligent health assessment system is constructed. It does not replace clinical diagnosis or perform invasive treatment, focusing on health assessment, risk early warning, and lifestyle guidance.

5.2 Technical Path

- Multi-modal sensing: optics, bioelectrical impedance, microcirculation, biochemical indicators, etc.
- Multi-dimensional information fusion: age, constitution, daily routine, environment, family history, etc.
- AI unified modeling: assess conduction patency and energy homeostasis based on the unified energy field and life conduction theory
- Output: health score, abnormality prompt, risk warning, lifestyle suggestions, medical guidance

5.3 Application Value

This system enables family-oriented, grassroots, and universal health management, especially suitable for regions with weak medical resources, and provides underlying theoretical support for intelligent medical treatment.

6 Conclusions

1. The universe is composed of indivisible, immutable, and diverse minimum material units, and all phenomena follow unified laws.
2. The unified energy field formula achieves a unified description from microscopic particles to celestial bodies and from physical processes to life activities.
3. The essence of life is an energy homeostasis system, with the nerve-blood circulation unified conduction system as the core operating carrier.
4. Health arises from unobstructed conduction, disease from conduction block, and cancer from severe disorder of the conduction system.
5. Modern medicine has a directional bias in chronic diseases and tumors; the future should focus on overall conduction repair and self-healing activation.
6. Based on the unified theory, a safe, inclusive, and implementable AI intelligent medical system can be constructed, realizing a complete closed loop from basic theory to engineering application.

The “cosmic unified theory – life conduction system – intelligent medical treatment” system constructed in this paper is self-consistent, observable, verifiable, and scalable. It is an original unified theoretical system covering the entire field of natural sciences with significant practical medical value.
