Abstract

To break through the limitations of fragmented and compartmentalized research in modern medicine, this paper takes the Feng Dejian Unified Formula of Cosmic Matter and Energy ($\Phi = (\epsilon_x \cdot v^2 \cdot t \cdot T) / \epsilon$) as the underlying logic to construct a global medical theoretical framework and research directions for the living system. The formula has a self-consistent and closed dimension ($\text{kg} \cdot \text{m}^4 \cdot \text{K} / \text{s}^3$), takes the hydrogen atom as the reference quantity, and adopts the usage rules of unified ratio, setting unused physical quantities to 1, and free substitution across multiple scales, enabling global physical description from the micro to the macro level. This paper deduces and proposes four core frameworks: the human body is a material and energy network composed of the smallest units of cosmic matter; all tissues in the human body participate in the energy conversion effect; the nervous and blood circulation systems are the core hubs of energy conversion; a planar topological framework for human operation laws centered on material and energy conversion. This paper only constructs the theoretical system and puts forward research directions, without involving clinical experimental data and professional mechanism subdivision, and does not constitute clinical diagnosis and treatment suggestions. Compatible with existing medical consensus, this framework reconstructs the underlying logic of medicine with a holistic view and unified physical laws, providing a brand-new unified theoretical support for intelligent medicine, precision medicine and systems medicine.

Keywords: Unified Formula of Cosmic Matter and Energy; Feng Dejian Formula; Energy Conversion Effect; Life Conduction System; Material and Energy Network; Planar Medical Framework; Neuro-Circulatory Hub; Systems Medicine

1 Introduction

Modern medicine has achieved numerous results in subdivided fields, but long-term excessive fragmentation has led to the lack of a holistic view, making it difficult to explain the life phenomenon of "a single move affects the whole body" from a unified law. Core elements such as matter, energy, signal, structure, time and temperature lack a unified description system, and the essence of life operation and diseases cannot be systematically explained under the same framework.

The Unified Formula of Cosmic Matter and Energy proposed by Feng Dejian takes the basic material units as the starting point, realizing the unified expression of matter, energy, velocity, time, temperature and space compression ratio, with self-consistent dimensions, simple rules and global applicability. Introducing this formula into the field of life and medicine can establish a global life theory based on the underlying laws of the universe without relying on the barriers of subdivided disciplines, making up for the deficiencies of modern medicine such as the lack of a holistic view, fragmented indicators and difficulty in unification across scales.

Strictly following the logic of the formula, this paper only constructs the theoretical framework, clarifies the research directions and delimits the research boundaries, providing a basis for the subsequent cross-field verification of physics, biology and medicine.

2 Core Definitions of the Feng Dejian Unified Formula of Cosmic Matter and Energy

2.1 Formula Expression

$$\Phi = (\varepsilon_x \cdot v^2 \cdot t \cdot T) / \varepsilon$$

2.2 Definition and Dimension of Physical Quantities

Φ : Unified physical field quantity, dimension $\text{kg} \cdot \text{m}^4 \cdot \text{K}/\text{s}^3$

ε_x : Particle energy, dimension $\text{kg} \cdot \text{m}^2/\text{s}^2$

v : Velocity, dimension m/s

t : Time, dimension s

T : Temperature, dimension K

ε : Limit space compression ratio, dimensionless

2.3 Dimensional Deduction

$$(\text{kg} \cdot \text{m}^2/\text{s}^2) \cdot (\text{m}^2/\text{s}^2) \cdot \text{s} \cdot \text{K} \div 1 = \text{kg} \cdot \text{m}^4 \cdot \text{K}/\text{s}^3$$

The dimension is completely self-consistent and closed.

2.4 Formula Usage Rules

1. Take the laboratory original value of the hydrogen atom as the reference quantity and adopt the unified ratio;
2. For physical quantities not used in specific scenarios, set their units and values to 1 for substitution;
3. Substitute on demand at any scale such as micro, macro, particle, field and living system;
4. The formula structure remains permanent and universally applicable.

3 Logical Deduction of the Formula in the Field of Life and Medicine

3.1 The Human Body is a Material and Energy Network Composed of the Smallest Units of Cosmic Matter

All cells, tissues and organs of the human body are composed of the smallest units of cosmic matter in different combination ways. These units form a continuous network through spatial structure and energy correlation, which is the material basis of "a single move affects the whole body". The change of the material and energy state of a certain node will be transmitted to the whole domain along the network, showing physiological fluctuations or pathological reactions.

Formula support: The hydrogen atom as the reference can uniformly describe the smallest units; ε (space compression ratio) determines the structural differences of tissues; Φ can quantify the field state of any node.

3.2 All Tissues in the Human Body Participate in the Energy Conversion Effect

The essence of life is the continuous absorption, conversion, conduction and dissipation of energy. There is no tissue in the human body that does not participate in energy conversion, with only differences in conversion form, efficiency and velocity. Tissues regarded as "auxiliary structures" in traditional medicine are all necessary nodes of the energy conversion network under the unified framework.

Formula support: Any tissue has ε_x (particle energy), v (molecular/material movement velocity) and T (temperature), so there must be a non-zero Φ , that is, it must participate in energy conversion.

3.3 The Nervous and Blood Circulation Systems are the Core Hubs of Energy Conversion

In the living system, energy conversion relies on signal regulation and material transport.

- The nervous system dominates signal conduction, corresponding to v (conduction velocity) and ε_x (energy regulation) in the formula;
- The blood circulation system dominates the transport of material and energy carriers, corresponding to v (flow velocity), ε_x (carrier energy) and t (transport time) in the formula.

Together, they form the core axis of global energy conversion and maintain the steady state of the human Φ field.

3.4 Planar Topological Framework for Human Operation Laws Centered on Material

and Energy Conversion

Abandoning the interference of three-dimensional anatomy, a two-dimensional planar framework is constructed with material and energy conversion as the core:

- Nodes: Cells/tissues, with Φ value as the core attribute;
- Links: Material and energy conduction relationships, described by v , ε_x and t in terms of intensity and direction;
- Axis: Neuro-circulatory dual hubs;
- Abnormality annotation: Changes in nodes/links directly correspond to pathological conduction pathways.

This framework can intuitively present the global logic of life operation laws and the occurrence and development of diseases.

4 Core Directions of Medical Research Based on the Unified Formula

1. Basic Theory of Energy Conversion Effect and Life Conduction System

Establish a unified physical description of energy conversion, conduction, blockage and imbalance of systemic tissues.

2. Explanation of the Essence of Diseases as Material and Energy Imbalance

Define diseases by Φ field abnormality, conduction interruption and decreased conversion efficiency, replacing the single symptom description.

3. Global Regulation Strategy for Intelligent Precision Medicine

Take restoring the connectivity of the material and energy network, stabilizing the Φ field and optimizing energy conversion as the core goals.

4. Unified Description of Life Across Multiple Scales

Realize the unified calculation across scales from the smallest material units $\rightarrow$ cells $\rightarrow$ tissues $\rightarrow$ human body with the same formula.

5. Planar Medical Visualization System

Construct an intuitive, standardized and dynamically demonstrable map of human material and energy operation.

6. Cross-Field Fusion Verification

Physics, physiology, medicine and informatics jointly carry out reference calibration and verification.

5 Research Boundaries and Statements

1. This paper is a pure theoretical framework preprint, without clinical experiments, data collection and pathological subdivision;

2. It does not provide specific diagnosis and treatment plans, and does not replace existing medical norms;

3. The calibration of numerical values and ratios of all physical quantities, as well as clinical verification, will be completed by professional teams in the follow-up;

4. This paper is compatible with the known facts of modern medicine, and does not deny or conflict with existing mature conclusions;
5. This paper follows the preprint norms, has not undergone peer review, and is only used for academic exchange and direction guidance.

6 Conclusion

The Feng Dejian Unified Formula of Cosmic Matter and Energy has global applicability and dimensional self-consistency, and can be used as the unified underlying theory for the research of living systems and medicine. Based on the formula, this paper deduces four core systems: the human material and energy network, systemic energy conversion, the neuro-circulatory dual hub, and the planar topological framework, providing a holistic research paradigm for modern medicine based on the laws of the universe. Compatible with existing medical achievements, this framework makes up for the lack of a holistic view with unified physical laws, and provides a brand-new theoretical basis and direction guidance for the future development of intelligent medicine, systems medicine and precision medicine.
