

Title

Life Conduction System Theory: Unified Understanding of Disease Essence and Directional Reflection on Modern Medicine

Abstract

Modern precision medicine, with microscopic molecular, genetic, cellular and targeted intervention as its core paradigm, has achieved remarkable efficacy in the treatment of acute organic diseases, trauma, infection and partial tumors. However, it is plagued by inherent limitations including treating symptoms rather than root causes, high recurrence rates and the lack of holistic regulation in managing chronic metabolic diseases, functional diseases, psychosomatic diseases and complex chronic conditions. Based on the Unified Theory of Cosmic Minimum Matter Units, this paper advances the Life Conduction System Theory: the human body is not a mechanical assembly of organs and cells, but an integrated living carrier characterized by the unified conduction of matter-energy-information. The essence of disease is not the abnormality of local targets, but the external manifestation of blocked overall conduction pathways and disrupted energy homeostasis. This paper demonstrates that observation and intervention tools are inherently constrained by the material basis of their own composition, leading to a fundamental logical paradox—just as the eye cannot directly observe its own structural origin, human beings' existing technical systems are logically incapable of the direct observational verification of the cosmic minimum matter unit. Thus, medicine should abandon the obsessive pursuit of infinite microscopic dissection, and instead return to the core approach of macroscopic homeostasis, systematic conduction and holistic regulation. Furthermore, this paper proposes a novel medical framework integrating microscopic precise intervention with macroscopic systematic regulation, which provides a theoretical foundation and directional guidance for the development of intelligent precision medicine, integrative medicine and future health systems.
